

1 Overview

1.1 Location `$<AMDAPPSDKSamplesInstallPath>\samples\opencl\cl\1.x`

1.2 How to Run See the *Getting Started* guide for how to build samples. You first must compile the sample.

Use the command line to change to the directory where the executable is located. The default executables are placed in `$<AMDAPPSDKSamplesInstallPath>\samples\opencl\bin\x86` for 32-bit builds and `$<AMDAPPSDKSamplesInstallPath>\samples\opencl\bin\x86_64` for 64-bit builds.

Before building this sample:

- Ensure you have the DirectX SDK or the SDK for Windows 8 installed.

Type the following command(s).

1. `SimpleDX11`
Produces the image of a moving sine wave with a bitmap in the background.
2. `SimpleDX11 -h`
This prints the help message.

1.3 Command Line Options Table 1 lists, and briefly describes, the command line options.

Table 1 Command Line Options

Short Form	Long Form	Description
-h	--help	Display all command options and their respective meanings.
-q	--quiet	Quiet mode. Suppresses all text output.
-e	--verify	Verify results against reference implementation.
	--dump	Dump binary image for all devices.
	--load	Load binary image, and execute on device.
	--flags	Specify compiler flags to build the kernel.
-p	--platformId	Select the platform ID to be used (0 to N-1, where N is the number of available platforms).
-d	--deviceId	Select device ID to be used (0 to N-1, where N is the number of available devices).
-v	--version	AMD APP SDK version string.

2 Implementation Details

You must have a graphics driver and an OpenCL runtime that support the Direct3D 11 media sharing extension. To verify that they are installed, run `clinfo` from the command line, and check if your device supports the `cl_khr_d3d11_sharing` extension.

The following are the key functions of SimpleDX11:

```
clCreateFromD3D11BufferKHR  
  
clEnqueueAcquireD3D11ObjectsKHR  
  
clEnqueueReleaseD3D11ObjectsKHR  
  
clGetDeviceIDsFromD3D11KHR
```

3 Algorithm

The following equation is used to compute the sine wave shown in the program:

$$y = \sin(x + t) \times \cos(x + t);$$

where x is the position on the X axis, and t is the time.

4 Sample Design

The input of this sample is a `.bmp` picture. This example reads in the data of the picture, calculates a sine sector using the OpenCL kernel, and renders and shows this picture using D3D11.

Steps:

1. Create a D3D11 offscreen surface using the D3D11 API `D3D11CreateDeviceAndSwapChain`, and initialize DirectX11 as shown in [Figure 1](#).

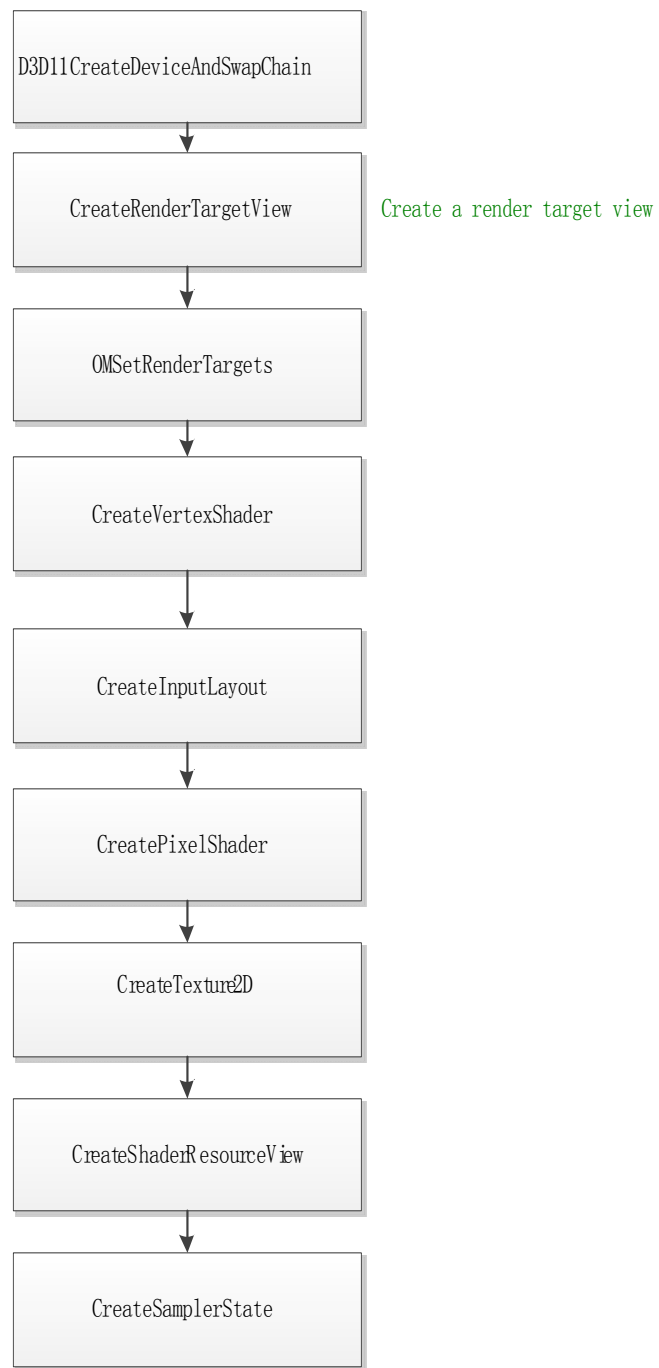

Figure 1 **Initializing DX**

- Set up the OpenCL environment as shown in [Figure 2](#). Use `vetexBufPtr` to create an `ID3D11Buffer` with a pointer. Use `IASetVertexBuffers` to bind it to the device. Use `pfn_clCreateFromD3D11BufferKHR` to create an OpenCL buffer with DirectX11 for surface sharing.

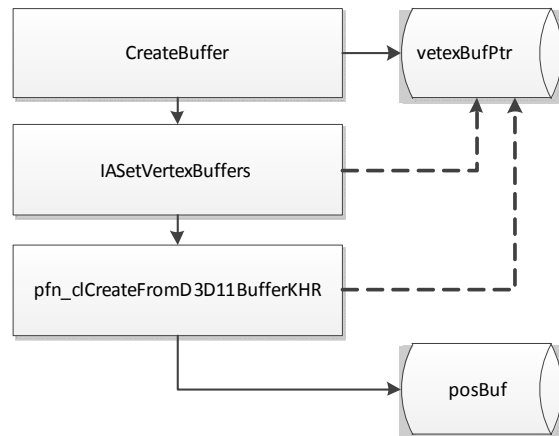

Figure 2 Setting Up CL

- Run the kernel as shown in [Figure 3](#). Before invoking `clEnqueueNDRangeKernel`, use `pfn_clEnqueueAcquireD3D11ObjectsKHR` to acquire the D3D11 object. After using `clEnqueueNDRangeKernel`, use `pfn_clEnqueueReleaseD3D11ObjectsKHR` to release the D3D11 object.

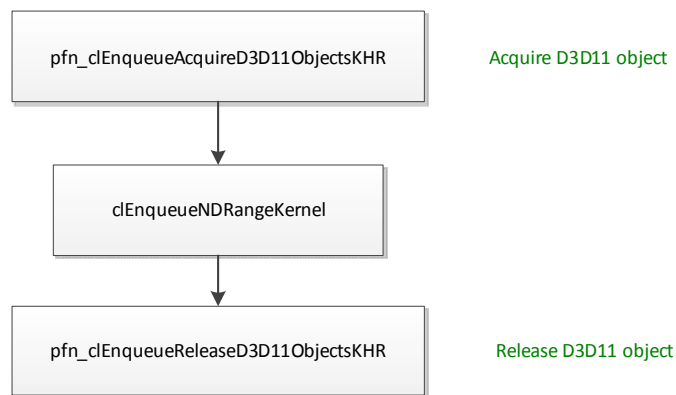

Figure 3 Running the Kernel

- Copy the picture surface into the texture surface, and set the vertex for rendering.
- Call the D3D11 function `present` to show the picture.

5 Sample Effect

The screen shots below show sample effects.
